**SHELLEVIS®
MAINTENANCE
INSTRUCTIONS**

GUIDED BY NATURE

We believe it's important that an outdoor space is well-balanced and exudes tranquility. Because in a living environment like that, you can relax; you're in your element, enjoying it. Whether alone or together with others. The outdoor space is the Schellevis® domain and nature is a major source of inspiration. We connect architecture with nature, with respect for the environment. That's how we contribute to a sustainable, natural experience of the outdoor space.

THIS IS HOW TO EASILY KEEP YOUR SCHELLEVIS® PRODUCTS BEAUTIFUL!

Schellevis® products are high quality and need little maintenance.

Cleaning

Everything that's standing outdoors will get dirty, sooner or later. And that naturally applies to the Schellevis® products too. Use a soft broom or brush to clean our products easily.

Don't allow leaves to pile up on tiles or stones. The tannic acid in tree leaves can leave marks but don't worry: they'll disappear on their own in time. If the products have only just been placed and a white limescale layer is visible, this will disappear with time and does not affect the quality of the products.

To clean larger surface areas, you can also use a power sweeper. Make sure that it is equipped with soft brushes made of nylon or synthetic material. You must never use a power sweeper with steel brushes. You will irreparably damage the products.

If the dirt cannot be removed with a soft broom or if there are stains, try removing them with water from the garden hose or with soft soap and water.

The best way of avoiding stains is naturally to remove dirt immediately and sweep your patio regularly. It's also wise when doing so to move or clean flower pots and other elements regularly. That way, you avoid outlines and discolouration and reduce the chances of algae and weeds growing.

Green mould

Green algae grow easily in shaded and damp places. When the sun gets stronger, algae growth usually disappears of its own accord. If however you'd like to speed up the process, remove the mould with water, soft soap and a gentle brush or broom. Another solution is to use steam. Steam kills off algae and moss.

Never use a high-pressure cleaner on our products. It's only a temporary solution and you damage the surface, which only means the algae grow back faster.

We don't advise you to use synthetic cleaning agents since they could change the texture and colour. Schellevis® products are made of natural raw materials which may not be resistant to such agents. If you do decide to use a cleaning agent, test it out first on a small area to see what the effect is.

In frost and snow

In frosty conditions, it's wise to salt as a precaution. Our products are resistant to road salt. Do salt only in moderation and make sure no salt piles up. Use a rubber snow shovel or broom to clear snow from a patio or garden path to avoid scratches.
